
Installation Instructions for the “X” Strobe Module.

To be used with **LED** lamps **ONLY**.

INPUTS

White wire to ground.

Black wire to switched 12v power.

Red wire to backup lamp circuit.

Yellow wire to left turn circuit.

Green wire to right turn circuit.

OUTPUTS

Blue wire to left turn.

Green wire to left turn.

Purple wire to right turn.

Grey wire to right turn.

Purple and Blue flash together.

Green and Grey flash together.

When LED lamps are set up, make sure that you separate the output flash sequence. For example, have the Purple output on the lower right, and the Green output on the lower left. Then have the Blue output on the upper left, and the Grey output on the upper right.

The turn signals will function as normal when the module is not switched on. The turn signals will run “through” the module, and will not be affected.

When the module is turned on however, the turn signals will override the strobe pattern, making them visible.
